

Why is it a success?

Skovby has developed, in cooperation with skilled architects, a stool made entirely from waste materials from its own production. Pieces cut from round and elliptical shaped tables are brought together to create a stackable and sustainable stool made entirely from leftover pieces from the production.

Lesson Learnt

The stool offers long time storage of CO2 and a reduced pull on virgin resources from our forests. Skovby has learnt how to deliver high quality wood products based on a circular production process. More products such as small cabinets and a coat rack constructed on the same principle are on their way from Skovby.

Producer

Skovby

Since 1933 the passion for wood and good craftsmanship have been the driving force for Skovby Furniture producing high quality furniture in Denmark - ensuring long life products.

Challenges

The main challenge was to design commercially viable products from leftover materials, minimizing waste. This required developing and purchasing specialized equipment to handle the unique dimensions of the leftover wood.
